

Dynamic Diversion System

A fully automated, flexible approach to the management of congestion or queuing hotspots during roadworks or major events.

Traffic flow information is transmitted directly in real-time and processed by the JamLogic™ control platform. Variable Message Signs (VMS) sited at key locations autonomously display real-time road condition information. If traffic volumes on the main route build to critical levels, the intelligent operating platform will divert motorists onto pre-defined diversion corridors.

Once traffic becomes free-flowing VMS will update road users and divert traffic back onto the main route and away from key diversion routes. This diversion route system is fully automated and road critical information is displayed in real time.

Benefits

Process third-party traffic data in real time using our JamLogic operating and control platform

Reduce heavy traffic flow on often reduced capacity diversion route networks (towns and villages)

Control traffic flow through major schemes, by efficiently utilising roadspace
