

Incident Management

Our portable cameras, traffic sensors and Variable Message Signs (VMS) can all be integrated to provide a complete incident management solution on any project.

Our JamLogic™ software gathers and processes critical traffic information from multiple hardware sources and third-party data provision. Road condition information is then automatically relayed in real-time to VMS and project teams.

Email and text alerts can be automatically triggered allowing full project overview and control. CCTV, TASCAR, emission, weather and traffic (microwave, queue detection radar, works egress and stopped vehicle advance warning) sensors can all integrate through JamLogic for additional project control.

Full analysis and reporting can be generated at the touch of a button using our intuitive platform which also integrates with stakeholder public websites for real-time traffic updates.

Benefits

Faster, more informed decisions

JamLogic brings together live data from cameras, sensors, VMS, and third-party providers so teams can respond instantly and keep traffic flowing safely.

Greater control and visibility

Automated alerts, real-time sign updates, and easy reporting provide a complete overview of roadworks without being on site.

Improved efficiency and outcomes

Integrate multiple systems into one intuitive platform to maximise productivity
