

Journey Time System

Automate real-time road critical traffic information and enable key travel time details to be actively displayed to motorists.

Our Journey Time System calculates the amount of time it takes drivers to travel between different points in a work zone or roadway system. It informs the motorist, in advance, of queues and areas of congestion, providing variable speed information, travel time and alternative routes.

The real-time traffic data is collected using either strategically placed sensors or third party data such as National Highways Datex II, TomTom, Google or

HERE. Our JamLogic™ Software then analyses the information and displays it to drivers on our variable message signs (VMS) in real time. The system is fully automated.

Benefits

Provide reliable, real-time information to motorists and project teams - Enhance road worker and motorist safety by providing critical road condition information

Key traffic data and reporting available to project teams - Enhance scheme performance and enable future scheme design / planning

Reduce congestion and increase capacity through roadworks - Smooth traffic flow for increased efficiencies
